Re: Notice of Ex Parte, PS Docket No. 18-64

APCO presents this ex parte to offer suggestions on the Commission’s draft Public Notice to Refresh the Record on Location-Based Routing for Wireless 9-1-1 Calls.¹ In the attached, APCO provides an edited version of the Public Notice.²

APCO commends the Commission for refreshing the record to continue to address the importance of location-based routing.

The edits we offer are intended to improve the record to be developed by clarifying that “Next Generation 9-1-1,” as defined by the public safety community, has not yet been fully deployed, and that “transitional NG9-1-1” environments entail the deployment of emergency services IP networks (ESInets) that are intended to implement some call-delivery elements of an end-state NG9-1-1 environment. Further, AT&T’s recent announcement that it will soon provide location-based routing nationwide illustrates, as APCO has previously commented, that wireless carriers can implement location-based routing regardless of whether an ESInet is in place.³ Accordingly, the attached edits are intended to make the Public Notice more prominently reflect this recent development.

Respectfully submitted,

APCO INTERNATIONAL

Attachment
Background: Americans expect that when placing a wireless 911 call, the call will be directed to, and answered by, the public safety answering point (PSAP) that has the ability to promptly dispatch aid to the caller’s location. Currently, most wireless 911 calls are routed through the cell site (tower) where the call is received and are sent to the PSAP associated with that cell site. Sometimes, however, the 911 call is sent to the wrong PSAP because the cell site where the call was received is not in the same jurisdiction as the 911 caller. Each time a wireless 911 call is routed to one PSAP and must be transferred to another, the call transfer process consumes time and resources, and the process ultimately delays the ability of first responders to reach the scene of the emergency.

Location-based routing technologies allow carriers to route wireless 911 calls based on location information gathered from the handset, rather than the location of the cell tower. In 2018, the Commission released a Notice of Inquiry seeking comment on the feasibility of using location-based routing to reduce the number of wireless 911 calls that are routed to an inappropriate PSAP. Since then, there have been several publicly announced advancements in location-based routing technology and some implementation of location-based routing on wireless networks. In many situations it may now be feasible to route wireless 911 calls directly to the correct PSAP based on more precise information about the caller’s location.

What the Public Notice Would Do:

- Invite parties to provide the latest information on improvements to location-based routing technologies and deployment of such technologies in wireless carrier networks since the 2018 Notice of Inquiry.
- Ask for updated information on the frequency of 911 call misroutes and developments in technology, operations, or industry standards to address the problem of misroutes.
- Seek comment on the feasibility of using location-based routing technologies for text-to-911.
- Ask for information on any interdependencies of location-based routing and Next Generation 911 (NG911) in order to optimize emergency response.
- Seek comment on how the Commission can facilitate improved wireless routing and promote location-based routing of 911 calls.

*This document has been circulated for tentative consideration by the Commission at its June 8, 2022, open meeting. The issues referenced in this document and the Commission’s ultimate resolution of those issues remain under consideration and subject to change. This document does not constitute any official action by the Commission. However, the Chairwoman has determined that, in the interest of promoting the public’s ability to understand the nature and scope of issues under consideration, the public interest would be served by making this document publicly available. The FCC’s ex parte rules apply and presentations are subject to “permit-but-disclose” ex parte rules. See, e.g., 47 CFR §§ 1.1206, 1.1200(a). Participants in this proceeding should familiarize themselves with the Commission’s ex parte rules, including the general prohibition on presentations (written and oral) on matters listed on the Sunshine Agenda, which is typically released a week prior to the Commission’s meeting. See 47 CFR §§ 1.1200(a), 1.1203.

By the Commission: []

With this Public Notice, we invite parties to update the record on issues raised in the 2018 Location-Based Routing for Wireless 911 Calls Notice of Inquiry (Notice of Inquiry), which sought comment on the feasibility of location-based routing as a means of reducing the incidence of misrouted wireless calls to 911 and improving emergency response times. The prior comment and reply comment period in this proceeding closed nearly four years ago. Given the passage of time since the prior comment period ended, enhancements in 911 location accuracy, and intervening developments related to location-based routing, we now seek to update the record in this proceeding. We seek comment on technological improvements to location-based routing, as well as the extent to which wireless carriers have deployed location-based routing in their networks. We also seek to update the record on steps the Commission could take to encourage the implementation of location-based routing or other improvements that would help to reduce misrouting of 911 calls and improve emergency response.

2018 Notice of Inquiry. In the Notice of Inquiry, the Federal Communications Commission (FCC or Commission) stated that transitioning from cell tower-based routing to location-based routing would significantly reduce the number of wireless 911 calls that must be transferred from one Public Safety
Answering Point (PSAP) to another and therefore that it “would be in the public interest and should be encouraged and actively facilitated.” The Commission sought comment on issues related to wireless 911 call misroutes and the current state of the implementation of location-based routing technologies, including existing standards and location-based routing capabilities in the context of Next Generation 911 (NG911). The Commission also asked detailed questions on the findings and recommendations regarding routing approaches identified in the report on location-based routing of the Communications Security, Reliability and Interoperability Council V (CSRIC V LBR Report). Additionally, the Commission requested that commenters discuss the means available to the Commission to facilitate improvements to 911 routing and reduce the likelihood of misrouted 911 calls, including the promotion of voluntary best practices, implementation of incentive-based mechanisms, or regulatory action, and other costs and benefits relating to location-based routing for Enhanced 911 (E911). The Commission received 22 comments and 14 reply comments.

---

3 Notice of Inquiry, 33 FCC Rcd at 3240, para. 4. Typically, wireless carriers route a 911 call to a PSAP based on the location of the cell sector that receives the call. Id. at 3240, para. 8. Due to the necessarily imprecise nature of cell sector-based routing, networks may route a wireless 911 call to a PSAP other than the one designated by the relevant 911 authority for the actual location of the caller. Cell sector-based routing can fail to route a 911 call to the appropriate PSAP for several reasons, including that more than one PSAP may be within the coverage area of a cell sector. Communications Security, Reliability and Interoperability Council V (CSRIC V), Working Group 1, Evolving 911 Services, Final Report – Task 2: 911 Location-Based Routing at 9 (2016) (CSRIC V LBR Report), https://transition.fcc.gov/bureaus/pshs/advisory/csrc5/WG1_Task2_FinalReport_092016.docx. The Commission considers such calls to be “misrouted.” Notice of Inquiry, 33 FCC Rcd at 3239, para. 2. In addition, it is important to note that the misroutes that are the subject of this inquiry generally result from current 911 call routing mechanisms that rely on cell tower location and are working as designed, not from technical failure of those mechanisms. Id. at 3239, para. 2 n.1. Calls misrouted to a jurisdiction that cannot dispatch assistance must be transferred, a process that consumes time and resources for both the first and second PSAP and delays dispatch and the ability of first responders to render aid. Id. at 3239, 3240-41, paras. 2, 8. In 2016, CSRIC V identified that location-based routing methods could be used to deliver a 911 call to a jurisdictionally appropriate PSAP and thereby reduce required call transfers, as long as the technology could obtain a location fix in 5 seconds or less. CSRIC V LBR Report at 3. CSRIC V defined location-based routing as “a system of rules to varying degrees of complexity dictating to where 9-1-1 calls from various locations are routed.” CSRIC V LBR Report at 6-7.

4 Notice of Inquiry, 33 FCC Rcd at 3246-51, paras. 17-33. The Notice of Inquiry sought information on the routing of wireless 911 calls, noting that advances in location technology could support initial call-routing based on a caller’s actual location. Id. at 3240, para. 3. The Commission also noted that while many location-based routing methods were promising, uncertainty remained regarding their reliability, the time required to develop necessary standards, and the potential transition costs of implementing location-based routing on current wireless 911 systems. Id. at 3240, para. 4.

5 Notice of Inquiry, 33 FCC Rcd at 3246-50, paras. 18-29. The five methods of location-based routing identified by CSRIC V include: (1) holding 911 calls until Phase II location data becomes available; (2) an “interim or quick fix” method that would hold calls at a wireless MSC or the PSAP gateway for up to six seconds to allow the wireless carrier time to deliver X/Y coordinates; (3) registered or provisioned civic address for certain devices; (4) device-based hybrid location; and (5) wireless 911 location accuracy emerging technologies. See CSRIC V LBR Report at 10-23.

6 Notice of Inquiry, 33 FCC Rcd at 3251-53, paras. 34-42.

7 Commenters included, among others, national public safety entities, state and regional 911 entities, nationwide carriers, emergency telecommunications service providers, a handset manufacturer, a technical standards organization, a public safety consulting firm, and concerned members of the public. Commenters offered varying opinions about whether technologies were capable of location-based routing without delaying 911 calls. See, e.g., AT&T Services, Inc. (AT&T) Reply Comments at 7-8, 11-12 (arguing that the Commission should “proceed cautiously,” as “[e]ven the most promising of location based technologies... have limits”); Motorola Solutions, Inc. Comments at 2 (asserting that testing has confirmed that location-based wireless routing is faster and more accurate
than legacy wireless routing). The comments and reply comments in response to the Notice of Inquiry may be viewed at: https://www.fcc.gov/ecfs/search/search-filings/results?q=(proceedings.name:"18-64")).
Developments Since 2018. We issue this Public Notice so that commenters may update the record to address developments of the last four years, which, as discussed below, include new studies on misroutes and location-based routing technology, increased deployment of device-based hybrid (DBH) location technologies, and implementation of location-based routing on wireless carrier networks. In 2018, CTIA announced that the nationwide wireless carriers planned to add DBH location technology to their networks to improve 911 location accuracy. In 2019, the Alliance for Telecommunications Industry Solutions (ATIS) published two studies with new information on misrouting and the feasibility of location-based routing. In those studies, ATIS concluded that “location-based routing is technically feasible within the timing considerations recommended by CSRIC V,” and evaluated where “sub-optimal routing” occurred for a sample set of emergency calls. In a 2019 ex parte filing in the instant docket, Apple Inc. noted that it had made DBH location technology available on certain device models that would support carrier implementation of location-based routing. In 2020, T-Mobile launched location-based routing on its network in Texas and Washington state. In 2022, AT&T announced a plan for a nationwide rollout of location-based routing on its network. In addition to these industry developments, the reported total of state expenditures on NG911 has increased from $228 million to over $364 million since 2018. The Commission has also taken steps to improve vertical location accuracy for wireless 911 calls and dispatchable location for fixed telephony, interconnected Voice-over-Internet Protocol (VoIP) services, Telecommunications Relay Services (TRS), and mobile text service.

---

8 Device-based hybrid location is an estimation method that typically utilizes either a selection or a combination of location methods available to the handset in a given environment, including crowd-sourced Wi-Fi, A-GNSS, and possibly other handset-based sensors. It also includes an associated uncertainty estimate reflective of the quality of the returned location. CSRIC V LBR Report at 16.

11 ATIS-0700042 at 22.

12 ATIS-0500039 at 1.

13 Letter from Paul Margie, Counsel for Apple Inc., to Marlene H. Dortch, Secretary, FCC, PS Docket No. 18-64 et al. (filed Sept. 24, 2019). Apple shared in an ex parte meeting that it offers wireless carriers the option to enable location-based routing for iPhone models 6s and later running iOS 13 and Apple Watch devices running watch OS 6. Id. at 2.

recently, the Association of Public-Safety Communications Officials, International (APCO) has urged the Commission to address location-based routing as part of a proceeding on NG911.¹⁸

In light of these industry trends, regulatory changes, and NG911 investments, we ask commenters to refresh the record regarding these and any other developments since the Commission’s issuance of the Notice of Inquiry in the relevant technology, operations, industry standards, or public expectations. More specifically, we seek information regarding the current state of play of cell sector-based misroutes, the implementation of location-based routing by wireless carriers, interdependencies of location-based routing and NG911 to optimize emergency response, location-based routing technology, the use of location-based routing for text-to-911, security considerations of location-based routing, the means available to the Commission to improve 911 routing, and related costs and benefits.

Cell Sector-Based Misroutes. In the Notice of Inquiry, the Commission sought comment on the frequency of 911 call misrouting and its impact on public safety, as “[a]ny solution to the problem of misrouted 911 calls must be preceded by a determination of the dimensions of the problem.”¹⁹ We seek updated information relating to the extent of the problem of cell sector-based misroutes. How many calls are misrouted on a yearly basis? What proportion of wireless 911 calls are delayed due to the need to reroute them to the correct PSAP and what is the typical length of such delays? For example, does the time required to locate the correct PSAP and reroute the call typically take at least a minute? Is the time required to reroute misrouted calls rising, declining, or staying constant over time? We also seek to update the record on any additional information that would help characterize the problem of cell sector-based misroutes.²⁰ Beyond the studies described above, have there been additional studies identifying locations or characteristics of locations where misroutes tend to occur?²¹ Has the implementation of 5G technologies impacted the prevalence of misroutes from cell sector-based routing and, if so, how?²²

Wireless Carrier Implementation of Location-Based Routing. We seek comment on the current implementation of location-based routing on wireless carrier networks. Commenters should specify to what extent location-based routing solutions have been implemented, the experience of PSAPs receiving wireless 911 calls via these solutions, the strengths and shortfalls experienced during implementation or testing, and any reasons why implementation of location-based routing would not be achievable. How does the implementation of location-based routing differ in legacy, and Emergency Services Internet Protocol Network (ESInet) and NG911.

¹⁹ Notice of Inquiry, 33 FCC Rcd at 3246, para. 17.

¹⁸ See, e.g., Texas 9-1-1 Entities Comments at 5-6 (indicating that the prevalence of misroutes varies greatly between cell sectors for one emergency network in Texas).
For example, *ATIS-0500039* indicates that misroutes tend to arise in locations with particular characteristics, such as along PSAP boundaries, in areas having a dense concentration of PSAPs, for PSAPs fully surrounded by another PSAP, around major water features, and along narrow strips of jurisdictional territory. *ATIS-0500039* at 12-13.

See, e.g., Texas 9-1-1 Entities Comments at 8; Comtech Telecommunications Corp. Comments at 8; National Emergency Number Association (NENA) Reply Comments at 2.
environments? Have wireless carriers conducted any new testing or trials of location-based routing in cooperation with PSAPs, state or regional 911 authorities, or technology vendors? What are the one-time and ongoing costs for wireless carriers implementing location-based routing solutions in legacy E911 and ESInet transitional, and NG911 environments, including costs related to updating system architecture, testing, ongoing operation, and satisfying security requirements? Are there costs for PSAPs when wireless carriers implement location-based routing? If so, what are they? Where location-based routing is deployed, what solutions are used, and how well do these solutions perform? In such areas, what percentage of calls are routed using location-based routing versus cell-sector routing? What has been the impact on the number of misroutes, that is, did implementing location-based routing increase, decrease, or have no effect the number of misroutes? What obstacles remain for wireless carriers implementing location-based routing? To what extent have small carriers implemented location-based routing solutions? Are there specific considerations for small carriers with respect to implementing location-based routing for 911 calls?

We also seek comment on any planned implementation of location-based routing on wireless carrier networks. As noted above, AT&T recently announced that it plans to deploy location-based routing nationwide, without regard to whether transitional NG9-1-1 has been deployed. Do other wireless carriers plan to implement or expand location-based routing on their networks? If so, on what timelines, and what are the criteria for determining when and where to expand location-based routing? How if at all is location-based routing different for PSAPs that are not connected to an ESInet? What is required for wireless carriers to implement location-based routing in legacy E911 environments, transitional, and NG911 and ESInet environments, including standards, costs, and network components? On what timelines could wireless carriers implement location-based routing in legacy E911, transitional, and NG911 and ESInet environments?

Transitions to Next Generation 911 and Location-Based Routing. We seek further comment on the interdependencies of location-based routing technologies and NG911 to optimize emergency response. For example, the Commission observed in the Notice of Inquiry that the adoption of location-based routing could provide an incentive for PSAPs and wireless carriers to transition to NG911, because NG911 systems are designed to route calls using caller location obtained in real time. Is this assumption still valid? Commenters responding to the Notice of Inquiry provided diverse opinions regarding whether the implementation of location-based routing should proceed independently of NG911. Has the availability of location-based routing incentivized the transition to NG911? Or, has the implementation of transition to NG911 incentivized wireless carriers to transition to location-based routing? Does the availability, speed, accuracy, or reliability of location-based routing capabilities improve as PSAPs transition from legacy 911 to NG911 operations?

If so, how? Has the implementation of ESInetsNG911 resulted in the number of cell sector-based misroutes increasing, decreasing, or staying constant? Do new routing issues arise with the implementation of ESInetsNG911? If so, how can the Commission help to address these issues? How can the Commission help to ensure that the delivery of location information to NG911 is consistent with NG911 systems and architecture? As noted above, some carriers are voluntarily offering location-based routing regardless of whether a state or jurisdiction has deployed an ESInet. Should it continue to be the responsibility of originating service providers to route calls based on the caller’s location, regardless of the routing capabilities provided by an ESInet? What steps can the Commission take to help ensure that carriers deliver adequate location information so that a 911 authority can appropriately route calls? In areas that have not yet implemented full NG911 functionality, what are the potential costs and benefits of implementing location-based routing?

23 Next Generation 9-1-1 has not yet been fully deployed anywhere in the United States. Legislative proposals supported by national public safety organizations would adopt a comprehensive definition of NG9-1-1 and create a federal grant program to implement NG9-1-1 nationwide. For purposes of this Public Notice, we conclude that
“transitional NG9-1-1” generally means the deployment of emergency services IP networks that are intended to implement some call-delivery elements of an end-state NG9-1-1 environment and we focus our inquiry accordingly.

23 Notice of Inquiry, 33 FCC Rcd at 3240, para. 4. In a legacy E911 environment, carriers route wireless calls using the pre-registered location of the tower and radio antennas through which the 911 call was placed. Id. at 3251, para. 32. In a fully implemented NG911 environment, carriers deliver device location derived from a Location Information Server to the ESInet, and the 911 authority determines how to route a 911 call to the appropriate PSAP. Id. at 3251, para. 32.

24 See, e.g., CTIA Comments at 6-7 (arguing that “the Commission should weigh whether the better course is to devote resources to a standalone location-based solution falling solely on the originating service provider or instead to advance and incentivize NG911”); T-Mobile Comments at 7 (“[d]iverging resources to redesign routing for legacy operations could ultimately slow the transition to NG911”); NENA Reply Comments at 2-3 (asserting that “concerns that pursuing LBR improvements to E9-1-1 will slow the transition to NG9-1-1 are overstated” and arguing that the Commission should not wait for NG9-1-1 to fix problems with call routing); Texas 9-1-1 Entities Reply Comments at 3 (arguing that both “E9-1-1 and NG9-1-1 need attention in the current environment, as E9-1-1 and NG9-1-1 are not currently mutually exclusive and may not become so for a very long time”).
routing? What burdens, if any, are placed on the PSAP if a carrier implements location-based routing in a jurisdiction that has not yet implemented full NG911 functionality?

In the Notice of Inquiry, the Commission sought comment on the CSRIC V LBR Report finding that while NG911 services are designed to receive a registered or provisioned civic address or a device-based hybrid location in time to route the call to the jurisdictionally appropriate PSAP, these features are dependent on the IP-to-IP interconnection between wireless carriers and NG911 ingress components, which at the time of CSRIC’s report had not yet been implemented by wireless carriers.25 We seek comment on whether and to what extent carriers have made progress implementing IP-to-IP interconnection. If no or little progress has been made, what obstacles do wireless carriers face? What steps, if any, can the Commission take to mitigate these barriers?

Current State of Location-Based Routing Technologies. We invite commenters to update the record on the current state of location-based routing technologies, including the five technologies identified by CSRIC V, and the extent to which such technologies would be capable of supporting location-based routing today within the time constraints defined by CSRIC V.26 According to CSRIC V, the location must be calculated in five seconds or less with a fairly high degree of accuracy for location-based routing to be effective in delivering the 911 call to the jurisdictionally appropriate PSAP.27 In 2016, the CSRIC V LBR Report found promise in routing solutions that use DBH location.28 Some commenters cautiously agreed that DBH location technology could be used to route wireless 911 calls.29 For DBH location technology and other location-based routing technologies, what is the current latency for providing an accurate location? Commenters generally agreed with CSRIC V’s finding that delaying call routing on the timeframes for a Phase II location fix is not recommended.30 How quickly can 911 calls be routed using DBH location technology in cold-start and warm-start scenarios?31 Can location-based routing technologies still result in a misroute? If so, how often do such misroutes occur with location-based routing technologies? Should the Commission require carriers to provide information about the certainty of a route that uses location-based routing technology to PSAPs?

We also seek comment on the availability of location-based routing technologies for wireless subscribers, and scenarios in which location-based routing is not feasible. How widely available are DBH solutions on handsets on carriers’ networks? What percentage of handsets on carriers’ networks are

26 CSRIC V LBR Report at 9.
27 CSRIC V LBR Report at 9. CSRIC V noted that the voice portion of the wireless 911 call is routed by the Mobile Switching Center (MSC) no later than six seconds from when the caller presses “send.” Therefore, to route on location, that location must be available to the MSC in five seconds or less. CSRIC V LBR Report at 8.
29 See, e.g., NENA Comments at 4-5 (noting that current trends “gravitate toward warm-start GPS processes” but that the “proprietary nature of these location services, the unknown nature of the databases that underpin them, and their management and maintenance causes questions about how well those services can be safely applied”); AT&T Services, Inc. Reply Comments at 11-12 (noting that while promising, device-based hybrid location methods have limitations, such as where handsets are restricted by poor or no access to GPS and Wi-Fi).
30 CSRIC V LBR Report at 27. See, e.g., West Safety Services, Inc. Comments at 17-18; AT&T Reply Comments at 2; NENA Comments at 3. But see Boulder Regional Emergency Telephone Service Authority (BRETSA) Reply Comments at 3.
31 As the Commission previously noted, “[i]n a cold start, the RMS network and mobile device have either no GPA-related data or expired GPS-related data from a previous attempt to determine the device’s location”
whereas “[i]n a warm start[,] the network and mobile device do have access to some initial GPS data from a previous attempt to locate the device.” Notice of Inquiry, 33 FCC Rcd at 3249, para. 25.
capable of supporting location-based routing? For what kinds of users, and in what scenarios, would location-based routing not be a feasible routing method? For example, would location-based routing be feasible on devices such as non-service-initialized phones or for subscribers who choose not to or cannot use Wi-Fi or GPS?

Location-Based Routing for Text-to-911. In 2014, the Commission adopted text-to-911 rules requiring carriers to route texts to 911 using coarse location (cell ID and cell sector) or other equivalent means (commercial location-based services or through the device’s location application programming interface) that allow the covered text provider to route the text to the appropriate PSAP. We seek comment on the feasibility of implementing location-based routing for text-to-911. Is location-based routing a viable means of routing 911 text messages to the appropriate PSAP? Would changes to network, SMS servers, and handsets be required? If so, what changes? Would it require development of new standards? What percentage of devices on wireless networks could support location-based routing for text-to-911? Do wireless carriers have plans to implement location-based routing for text-to-911 on their networks?

Other Considerations for Location-Based Routing. We seek comment on any security, reliability, and privacy considerations related to location-based routing approaches. Does location-based routing raise any security or privacy concerns not previously addressed by the Commission in other proceedings? How can the Commission support the reliability of location-based routing?

Means Available to the Commission to Improve 911 Routing. We seek comment on steps the Commission could take to advance the implementation of location-based routing. Are there any incentives that we could create to encourage the development and implementation of location-based routing for wireless 911 calls? Are there regulatory steps we should take to advance the implementation of location-based routing and, if so, what are they? Moreover, what would be the costs and benefits associated with those suggested regulatory changes? Are there existing regulatory impediments to the development and implementation of location-based routing? If so, what steps could we take to remove those impediments?

We also seek comment on the means available to the Commission to mitigate the problem of misroutes arising from cell sector-based routing. Some commenters on the Notice of Inquiry argued that the Commission could take targeted or transitional action to address misroute-prone areas. Are there any incentives we could create to encourage parties to identify and address areas with high numbers of misroutes? Should we ask carriers to identify the cell sectors where misroutes tend to occur? Should the Commission ask PSAPs to report on the number of misroutes that occur? Are there targeted solutions unrelated to location-based routing that we can pursue in areas identified with high numbers of misroutes? What specific best practices for PSAPs and carriers can the Commission encourage to minimize misroutes when cell sector-based routing is used?

Digital Equity and Inclusion. Finally, as part of the Commission’s continuing effort to advance

---

33 See, e.g., NENA Reply Comments at 3 (arguing that “problem areas for routing could be prioritized in the deployment of LBR, while areas that see very few ‘misroutes’ can remain served by legacy cell sector routing techniques”); CTIA Reply Comments at 2 (asking the Commission to encourage targeted action, such as “additional coordination among PSAPs and by PSAPs with wireless providers”); BRETSA Comments at 10-11 (arguing that there are several measures which could be taken to mitigate Phase I misroutes, including modifying routing for sites
prone to misroutes, sectorizing cell sites to limit coverage of multiple jurisdictions by a single antenna, and reorientation of cell sectors).
digital equity for all, including people of color, persons with disabilities, persons who live in rural or Tribal areas, and others who are or have been historically underserved, marginalized, or adversely affected by persistent poverty or inequality, we invite comment on any equity-related considerations and benefits (if any) that may be associated with the issues discussed in this Public Notice. Specifically, we seek comment on how this inquiry into improving wireless location-based routing may promote or inhibit advances in diversity, equity, inclusion, and accessibility, as well the scope of the Commission’s relevant legal authority.

Filing Comments and Replies. All filings responsive to this Public Notice must reference PS Docket No. 18-64. Interested parties may file comments and reply comments on or before the dates indicated on the first page of this document. Comments may be filed using the Commission’s Electronic Comment Filing System (ECFS). See Electronic Filing of Documents in Rulemaking Proceedings, 63 FR 24121 (1998).

- Electronic Filers: Comments may be filed electronically using the Internet by accessing the ECFS: https://www.fcc.gov/ecfs/.
- Paper Filers: Parties who choose to file by paper must file an original and one copy of each filing.
- Filings can be sent by hand or messenger delivery, by commercial overnight courier, or by first-class or overnight U.S. Postal Service mail. All filings must be addressed to the Commission’s Secretary, Office of the Secretary, Federal Communications Commission.
- Commercial overnight mail (other than U.S. Postal Service Express Mail and Priority Mail) must be sent to 9050 Junction Drive, Annapolis Junction, MD 20701. U.S. Postal Service first-class, Express, and Priority mail must be addressed to 45 L Street, NE, Washington, DC 20554.
- Effective March 19, 2020, and until further notice, the Commission no longer accepts any hand or messenger delivered filings. This is a temporary measure taken to help protect the health and safety of individuals, and to mitigate the transmission of COVID-19. See FCC Announces Closure of FCC Headquarters Open Window and Change in Hand-Delivery Policy, Public Notice, 35 FCC Rcd 2788 (OMD 2020).

People with Disabilities. To request materials in accessible formats for people with disabilities (braille, large print, electronic files, audio format), send an e-mail to fcc504@fcc.gov or call the Consumer & Governmental Affairs Bureau at 202-418-0530 (voice), 202-418-0432 (tty).

Ex Parte Rules. This proceeding shall continue to be treated as a “permit-but-disclose” proceeding in accordance with the Commission’s ex parte rules. Persons making ex parte presentations must file a copy of any written presentation or a memorandum summarizing any oral presentation within

---

34 Section 1 of the Communications Act of 1934 as amended provides that the Commission “regulat[es] interstate and foreign commerce in communication by wire and radio so as to make [such service] available, so far as possible, to all the people of the United States, without discrimination on the basis of race, color, religion, national origin, or sex.” 47 U.S.C. § 151.

35 The term “equity” is used here consistent with Executive Order 13985 as the consistent and systematic fair, just, and impartial treatment of all individuals, including individuals who belong to underserved communities that have been denied such treatment, such as Black, Latino, and Indigenous and Native American persons, Asian Americans and Pacific Islanders and others of color; members of religious minorities; lesbian, gay, bisexual, transgender, and queer (LGBTQ+) persons; persons with disabilities; persons who live in rural areas; and persons otherwise adversely affected by persistent poverty or inequality. See Exec. Order No. 13985, 86 Fed. Reg. 7009,

36 47 CFR §§ 1.1200 et seq.
two business days after the presentation (unless a different deadline applicable to the Sunshine period applies). Persons making oral *ex parte* presentations are reminded that memoranda summarizing the presentation must (1) list all persons attending or otherwise participating in the meeting at which the *ex parte* presentation was made, and (2) summarize all data presented and arguments made during the presentation. If the presentation consisted in whole or in part of the presentation of data or arguments already reflected in the presenter’s written comments, memoranda or other filings in the proceeding, the presenter may provide citations to such data or arguments in his or her prior comments, memoranda, or other filings (specifying the relevant page and/or paragraph numbers where such data or arguments can be found) in lieu of summarizing them in the memorandum. Documents shown or given to Commission staff during *ex parte* meetings are deemed to be written *ex parte* presentations and must be filed consistent with Rule 1.1206(b). In proceedings governed by Rule 1.49(f) or for which the Commission has made available a method of electronic filing, written *ex parte* presentations and memoranda summarizing oral *ex parte* presentations, and all attachments thereto, must be filed through the electronic comment filing system available for that proceeding, and must be filed in their native format (e.g., .doc, .xml, .ppt, searchable .pdf). Participants in this proceeding should familiarize themselves with the Commission’s *ex parte* rules.

**Availability of Documents.** Comments, reply comments, and *ex parte* submissions will be publicly available online via ECFS. Documents will be available electronically in ASCII, Microsoft Word, and/or Adobe Acrobat.

**Additional Information.** For further information, please contact Rachel Wehr, Attorney-Advisor, Policy and Licensing Division, Public Safety and Homeland Security Bureau at (202) 418-1138 or Rachel.Wehr@fcc.gov.
